Company name: Jia Hua Food Court

Location: Grand Industrial Centre, 89500 Penampang, Sabah

What they do: Restaurant/Food court selling buns, cakes and drinks.

They also rent empty lots for vendors to sell their own food.

Part 1:

Major problems of the manual process:

- Jia Hua wants the staff to handle orders manually for their own stall, but can mess up the
 ordering process because the writing can be misinterpreted by others or the staff can take
 the customer's orders incorrectly. This can cause mistakes such as taking the wrong food
 to the wrong table, thus leaving customers unsatisfied and leaving bad reviews causing
 reputation damage.
- 2. Jia Hua wants to record the vendors' information. Records of the company are written and kept physically in books. This means important documents and data regarding their patrons are easily stolen, which could spell the downfall of their business and face serious charges due to failure to keep said information confidential. Furthermore, there are no backups of destroyed records.
- 3. Jia Hua's manual leave management is prone to errors such as miscalculations, incorrect recordings of leave days, and miscommunication, which can lead to human resources mismanagement, payroll discrepancies and employee dissatisfaction.
- 4. Restocking supplies manually risks losing or misplacing supplies. As the supplies needed are ordered from various suppliers, poor management will lead to disasters such as overbuying supplies. These problems will give the management a hard time managing the supplies. Poor management can cause a delay in payment or break the budget of the company.
- 5. Affairs of the entire food court are problematic to handle without a proper system as there are many challenges that need to be addressed throughout the year. When people want to rent slots for vendoring, the company might have issues with slot allocation for the renting as information regarding available slots is mixed up easily if handled manually through paper and pen.

Software Quality Attributes

1. Acceptability

By investing in acceptable software the restaurant staff members can minimize the amount of errors and inaccuracies during rush hour and normal restaurant operations due to how usable the software system is. It can also improve the service quality and customer satisfaction since the system will be more user friendly towards young and old customers.

2. Efficiency

Time management will be more efficient. With this, the delay between each order made by a customer will be minimal, smoothing staff services towards customers. The system would also handle employee affairs and schedule with more efficiency and while minimizing use of space for the system.

3. Maintainability

With the systematic software, it is easy to maintain changes in the company. Such as adding or removing selling goods and adjusting in goods prices in the system. It can also be flexible when it comes to employees' working schedule.

4. Dependability and Security

The software system will be dependable with its reliability to prevent physical and economical damage in the event of system failure. The system will also be able to protect itself from cyberattacks such as viruses or hacking attempts by malicious users in order to access or damage the systems. For instance, hackers cannot steal or alter business data in the system.

Software Process Model

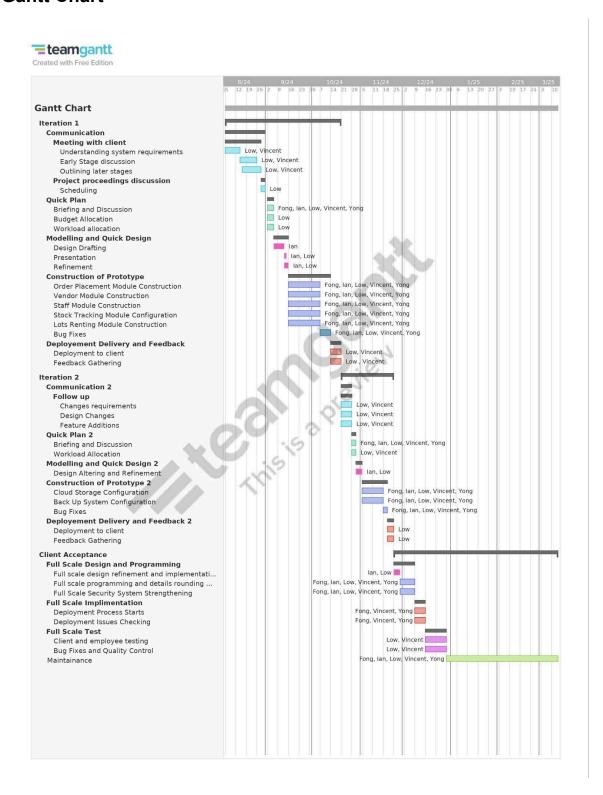

Prototyping Model - Evolutionary Prototyping is the software process model proposed for our system.

Software Process Model is a framework used to structure, plan, and control flow of work required to develop a software. It comprised of many specific activities and tasks. The goal is to provide guidance for systematically coordinating and controlling tasks that must be performed to achieve the end product objectives. In our software development, we use the model of evolutionary prototyping as a basis to achieve our goal. The evolutionary prototyping model is a structure where developers produce a firsthand prototype for showcasing to the client in question. This allows the client to gain a concrete impression of the system capabilities as well as experimenting with the requirements. This specific model is specifically aimed at clients that are unsure of or have yet to fully decide regarding requirements of the system as the prototype is not the final product.

Since our client finds it difficult to express their real requirements, we proposed the use of the prototyping model as our software process model. This is due to the fact that the prototyping model allows the customer to experiment with requirements to confirm what features they want in the system at a rapid software delivery and utilization pace.

Of the two types of prototyping model, we will use the prototyping evolutionary. This approach allows the restaurant to continuously collect and analyze feedback from customers. The feedback enables the restaurant to make data-driven decisions and improvements to meet customer needs and preferences. Prototyping evolution will also help with engaging customer's interest and ensure effectiveness before full-scale Implementation. With that, the prototype can be further modified to suit the client's future demand through the evolutionary prototype model since the client likely wants it to work.

Software Requirements Specification.

Functional Requirements:

Module 1 - Ordering Module:

- 1.1 The system shall allow the staff to select the menu items the customer wants to order and record the customer's table number.
- 1.2 The system shall allow staff to make changes to the order.
- 1.3 The system shall display the customer's orders to the kitchen staff.

Module 2 - Vendor Module:

- 2.1 The system shall be able to store data such as vendors' information.
- 2.2 the system shall allow staff to edit vendor information
- 2.3 The system shall have a searching function that allow quick access to vendors' information

Module 3 - Staff Module:

- 3.1 The system shall allow the employees to view their leave history and display remaining leave days for each employee
- 3.2 The system shall allow employees to submit leave requests into the system
- 3.3 The system shall allow staff to check their leave application progress

Module 4 - Supply Tracking Module:

- 4.1 The system shall track the inventory levels of supplies daily.
- 4.2 The system shall notify management when supplies levels are less than 20% of the existing supplies.
- 4.3 The system shall generate detailed reports on supply orders and its payments to help stay within budget.

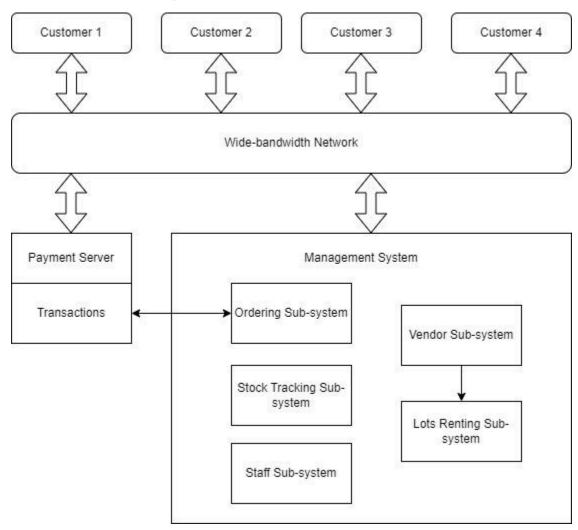

Module 5 - Lots Renting Module:

- 5.1 The system shall display available and unavailable slots for vendors to rent.
- 5.2 The system shall allow the management to check the vendors' rent status.
- 5.3 The system shall display information regarding the renter of each vendor.

Non-functional Requirements:

- 1.1 The system response time shall not exceed 3 seconds.
- 1.2 The system shall backup records daily.
- 1.3 The system shall not use more than 500MB of storage space.
- 1.4 The system shall have an uptime of at least 99.9% to ensure continuous operation, minimizing the risk of losing or misplacing supply orders due to system downtime.
- 1.5 The system shall not disclose any personal information to unauthorized personnel.
- 1.6 The system shall display information in a clean, clear and organized manner.
- 1.7 The system shall be able to protect the data with strong passwords

Architectural Design

Explanation:

Client Based Model is a distributed system model which shows how data and processing is distributed across a range of components. It consists of a set of stand-alone servers which provide specific services such as printing, data management, etc.

Justification:

We use this system because it utilizes cheaper hardware. Its network system is an incredibly effective system and the distribution of data is straightforward, simplifying the process.

Test Cases

163	Cases				
Test Case Name	Case invalid table number		Test Case Descriptio n	To check the ordering function by using valid menu item but invalid table number	
Pre-co	Pre-conditions:		Test Data:		
1	The staff has valid authentication		1	order = "Bun Kahwin"	
2			2	table number = 2190876	
3			3		
				ı	
Step #	Step Details	Expected Results		Actual Results	Remarks (Pass / Fail / Not executed / Suspended)
1	Click the "Start New Order" button	The ordering menu page is displayed.			
2	Select the items	The customer's order is selected.			
3	Type in the invalid table number	The invalid table number message is displayed. Table number is prompted for input until valid table number.			
4	Click the "Confirm" button	The cu			

Test Case Name	1.2.1 Change the order to a valid menu item	Test Case Descriptio n	To test the order changing function by changing the order to a valid menu item
Pre-co	onditions:	Test Data:	
1	The staff has valid authentication	1	new order = "Roti Kahwin"
2	The table number is valid	2	
3	The order has yet to be confirmed	3	

Step #	Step Details	Expected Results	Actual Results	Remarks (Pass / Fail / Not executed / Suspended)
1	Click the "Edit Order" button	The order editing page is displayed.		
2	Select the item to be edited	The item to be edited is selected and menu items are displayed to change the item to.		
3	Select the new item	The new item is selected. The updated list of items in the order is displayed.		
4	Click the "Confirm" button	The customer's order is confirmed.		

Test Case Name	1.3.1 Display valid customer's order its order number to the kitchen	and	Test Case Descriptio n	To test the order displays	ing function to the
